No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The polypeptide is probabally a DNA-binding protein probably involved in initiating transcription of the gene for ribosomal RNA 5s and maintaining the stability of transcription of other control genes. The htfIIIA polynucleotides and polypeptides are used to make therapeutic or diagnostic compositions for diseases associated with disorders of transcriptional control, particularly cancer or other inherited diseases. The htfIIIA polynucleotide can also be used to detect anomalies in gene transcription, particularly for diagnosis of inherited disease, also for studying diseases involving htfIIIA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 1213 BP; 349 A; 309 C; 302 G; 253 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence encodes a human transcription factor designated htfIIIA. The polypeptide is probabaly a DNA-binding protein probably involved in initiating transcription of the gene for ribosomal RNA STATE and maintaining the stability of transcription of other control genes and maintaining the stability of transcription of other control genes. The htfIIIA polynucleotides and polypeptides are used to make therapeutic or disponstic compositions for diseases associated with disorders of transcriptional control, particularly cancer or other inherited diseases. The htfIIIA polynucleotide can also be used to detect anomalies in gene transcription, particularly for diagnosis of inherited disease, also for studying diseases involving hTFIIIA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 1273 BP; 356 A; 329 C; 328 G; 260 T; 0 other;

AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The concern cantigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the preventic diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1261

Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and p can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AB77789 represent sequences used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         present invention

CO DNA chip analysis as given in the specification, and comparing
CC the expression level to an expression level in an unactivated
CC dC, where differential expression of Gs is indicative of GCA.
CC Also included are modulating (M2) GA by contacting GC with an agent
CC for an agent capable of modulating GCA or an inflammation (especially
CC chronic) in a tissue, an allergic response in a subject, exposure of a
CC gene expression profile; (3) detecting (M4) an inflammation (especially
CC chronic) in a tissue, an allergic response in a subject, exposure of a
CC gene expression profile; (3) detecting (M4) an inflammation (especially
CC chronic) in a tissue, an allergic response in a subject, exposure of a
CC level of expression of the gene is indicative of inflammation;
CC et a pathogen or sterile inflammatory disease, by detecting the
CC level of expression of the gene is indicative of inflammation;
CC an allergic response in a subject, exposure of a
CC inflammation with an agent that modulates the expression of gene(s)
CC from Gs in the tissue. M1 is useful for detecting GCA; M2 is useful for
CC modulating CA; M2 is useful for exponsion of an aneant canable of modulating

                                                                                                                                                                                                                                                                                    The sequence encodes human transcription factor-IIIA (hTFIIIA), a DNA binding protein with 9 zinc finger domains, which is necessary for the initiation of 55 RNA gene transcription, binding to an internal control region of the 55 gene. The coding region internal control region of the 55 gene. The coding region of colaimed) is given in AAT14037. A fragment lacking a 5'-portion of the gene has been isolated from a human foetal brain cDNA library internal control of cDNA ends using primers H11-R (AAT14039), complementary to anchor primer AAT14041). Reverse transcription using H-1R is anchor primer AAT14041. Reverse transcription using H-1R is collowed by anchor primer ligation and PCR using AP-2 and H11-E, to give a full-length cDNA, OTK7. The gene and its encoded protein cD may be used in diagnossis, identification or therapy of hereditary collabeases such as cancer, or other diseases resulting from abnormal transcriptional control, and to analyse the mechanisms involved in
                                                                                                                                                                                                                                    Query Match

                                                                                               밁
                                                                                                                      Ş
                                                                                                                                                                                                           The sequence encodes human transcription factor-IIIA (hTFIIIA), and binding protein with 9 zinc finger domains, which is necessary for the initiation of 55 RNA gene transcription, binding to an internal control region of the 55 gene. A fuller cDNA sequence with flanking regions is given in AAT14038. A fragment lacking a CC with flanking regions is given in AAT14038. A fragment lacking a CC cDNA library (OTK7-1), and the 5'-portion of the gene has been isolated from a human foetal brain CC cDNA library (OTK7-1), and the 5'-portion of the gene has been isolated by 5'-rapid amplification of cDNA ends using primers H11-R (CC (AAT14039), H11-E (AAT14040), H11-H (AAT14043). Reverse transcription using CC (H1R is followed by anchor primer ligation and PCR using AP-2 and CC H11-E, to give a full-length cDNA, OTK7. The gene and its encoded CC protein may be used in diagnossis, identification or therapy of hereditary diseases such as cancer, or other diseases resulting from abnormal transcriptional control, and to analyse the mechanisms

The invention relates to 2175 novel human ovarian antigens (ABP41054-CC ABP4328) and to CDNAs encoding them (ABP5431-ABP656305), and also CC encompasses polypeptides 90% identical and polynucleotides 95% identical CC to the sequences of the invention. The invention additionally relates to CC recombinant vectors and host cells comprising human ovarian antigen polynucleotides, antibodies against human ovarian antigens, and the use CC of ovarian antigen polynucleotides and polypeptides in diagnosing. CC treating, prognosing or preventing various ovary and/or breast-related CC disorders. Such conditions include ovarian cancer and breast cancer, and CC metastatic tumours of ovarian or breast origin, reproductive system CC disorders (e.g., infertility, disorders of pregnancy, anovulation, CC polycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine CC disorders, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic CC shock syndrome), inflammatory conditions (e.g., mastitis, cophoritis and CC usainitis), immine disorders (e.g., congenital and acquired conditions (e.g., mastitis, systemic lupus erythematosus), CC blood-related disorders (e.g., congenital and acquired disorders, neurological disorders, gastrointestinal disorders CC and urinary system disorders. Ovarian antigen polypeptides and CC computate ovarian antigen polypeptides and CC compounds which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; ovarian antigen; ovary; ovarian; breast, concer; cancer; tumour; reproductive system disorder; infertility; pregnancy disorder; anovulation; polycystic ovary syndrom PCOS; ovarian cyst; dysmenorrhoea; endocrine disorder; infection; inflammatory condition; immune disorder; blood disorder; cardiovascular disorder; respiratory disorder; neurological disorder; gastrointestinal disorder; urinary system disorder; drug screening; harnow; chromosome mapping; forensic analysis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The polynucleotides and encoded polypeptides are useful in pharmaceutical compositions, such as vaccines, for the diagnosis, prevention, and treatment of colon cancer. Polynucleotide sequences may be used as hybridisation probes or primers, and in the design and preparation of ribozyme molecules for inhibiting expression of tumour polypeptides and proteins in tumour cells. The compositions are useful for stimulating an immune response against cancer, particularly for the immunotherapy of colon cancer, and as markers for the progression of cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to polynucleotides encoding colon tumour proteins. The polynucleotides and encoded polypeptides are useful in pharmaceutica compositions, such as vaccines, for the diagnosis, prevention, and treatment of colon cancer. Polynucleotide sequences may be used as hybridisation probes or primers, and in the design and preparation of ribozyme molecules for inhibiting expression of tumour polypeptides and proteins in tumour cells. The compositions are useful for stimulating are
                                                                                                                                                                                                                                                                                                                                                        proteins of the invention.

Note: With the exception of SEQ ID No 1 and 2, the sequence dat for this patent did not form part of the printed specification supplied by the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                      immune response against cancer, particularly for the immunotherapy colon cancer, and as markers for the progression of cancer.

                                                                               Matches
                                                                                                                                                                used in antisense therapy. An antibody immunoreactive with a polypeptide encoded by (1) is useful for detecting the presence or absence of a polynucleotide encoded by a nucleic acid which hybridises to (I) in a cell. A probe/primer derived from (I) can be used for determining the presence of a nucleic acid which hybridises to (I), and for determining the phenotype of cells in a sample of cells from a patient. (I) is useful for determining the presence of colon cancer in a cell or tissue type, for determining the presence or state of other type of cancer, in antisense therapy, to generate corresponding gene resides, and in tissue profiling, forensics, genetic manufacture and disposations and in tissue profiling, forensics, genetic manufacture and disposations and in tissue profiling.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1154

```

```
a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of t specification or its complement. (I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;
(d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient;
(e) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient;
(e) assessing the prostate cell carcinogenic potential of a compound;
(f) assessing the prostate cell carcinogenic potential of a patient;
(h) assessing the aggressiveness or indolence of prostate cancer in a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1028
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1401
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a human eukaryotic initiation factor (eIF), designated heIF3), which is expressed in human dendritic cells. heIF3 has translation initiation factor activity. Also described in the present invention are methods for the preparation and detection of the heIF3 protein and nucleotide sequences. The present sequence encodes heIF3, as given in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human translation initiation factor protein and its

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polynucleotides are also used in diagnostics as expressed sequence tags of identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating care imaging of sites expressing (II). (I) and (II) are useful for treating care disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in the polypeptide and polynucleotide sequences have applications or responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and camino acid sequences. AAS64197-AAS9454 represent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at figure in the printed specification, but was obtained in electronic format directly from WIPO at figure in the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to polynucleotides encoding colon tumour proteins. The polynucleotides and encoded polypeptides are useful in pharmaceutical compositions, such as vaccines, for the diagnosis, prevention, and treatment of colon cancer. Polynucleotide sequences may be used as hybridisation probes or primers, and in the design and preparation of ribozyme molecules for inhibiting expression of tumour polypeptides and proteins in tumour cells. The compositions are useful for stimulating an immune response against cancer, particularly for the immunotherapy of colon cancer, and as markers for the progression of cancer.

ABK44450-ABK46337 represent coding sequences of human colon tumour cancer from the progression of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      03-AUG-2000; 2000US-223283P.

Biol. Chem. 269:20857-20865(1994).

-!- FUNCTION: INTERACTS WITH THE INTERNAL CONTROL REGION (ICR) OF APPROXIMATELY 50 BASES WITHIN THE 5S RNA GENES, IS REQUIRED FOR CORRECT TRANSCRIPTION OF THESE GENES BY RNA POLYMERASE III. ALSO BINDS THE TRANSCRIBED 5S RNA'S. MAY INITIATE TRANSCRIPTION OF THE 5S RIBOSOMAL RNA GENE AND MAINTAIN THE STABILITY OF TRANSCRIPTION OF OTHER GENES.

-!- TISSUE SPECIFICITY: UBIQUITOUS.
